Project Overview

DigiYatra App Redesign

DigiYatra is a paperless airport experience used by millions across India. The current home screen hides the most essential travel detail – flight time – forcing travelers to dig through email or WhatsApp. This redesign rebuilds the boarding-pass surface around glanceability, hierarchy, and calm, confident composition.

The Spark

A real complaint from a real user.

A LinkedIn post from a frequent traveler captured the exact friction the product was meant to remove published months after the app's national rollout.

Why would someone create an app like DigiYatra... and then miss the most obvious feature?

DigiYatra is brilliant in concept — scan your boarding pass, breeze through the airport with facial recognition, no paperwork, no waiting.

But here's the catch: it doesn't show you the flight time.

So after uploading the boarding pass, I still have to go hunting for the time — in WhatsApp, in my email, or dig out a physical copy. What's the point of scanning it in the first place if I can't quickly see the basic info I need?

This defeats the very purpose of streamlining the travel experience. Isn't the whole idea to reduce friction; not add to it?

This is a classic case of solving one part of the problem and overlooking the obvious — a reminder that real-world UX isn't just about features. It's about context.

Tagging the DigiYatra team: you've built something great — now make it complete.

What users actually struggle with.

1. **Flight timing not visible**
   The most important data point boarding/departure time is buried or missing from the home view.
2. **Forced context-switching**
   Users open WhatsApp, Gmail or a paper copy to find the time they expected the app to surface.
3. **Important info hard to access**
   Seat, Gate, PNR and Flight number are listed without hierarch everything looks equally unimportant.

Design Goal

Before opening Figma, we agreed on a small, opinionated set of goals. Each design decision had to defend itself against this list.

Goal 01

Improve glanceability

Critical info readable in under one second the time it takes to glance at a wristwatch.

Goal 02

Surface critical info instantly

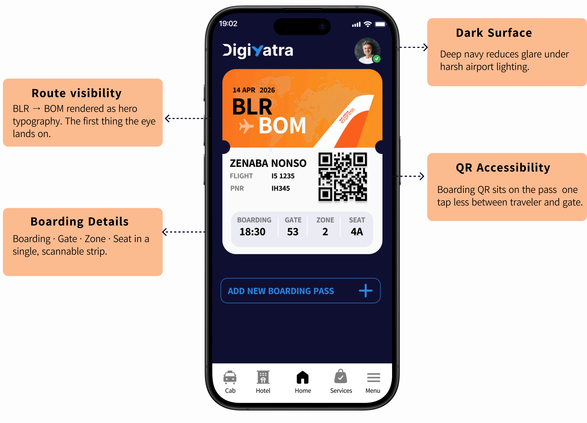
Time, route and gate above the fold. No taps, no scrolls, no guesswork.

North Star — "Show me my flight in one glance."

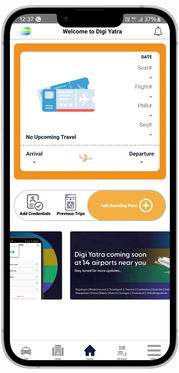
Constraint — Single screen redesign. No new flows, no engineering scope creep.

Success Metric — Time-to-find boarding time reduced from ~6s to under 1s.

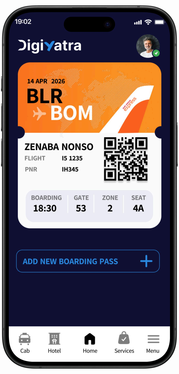
Final Design



Before • Current



After • Redesign



"Good UX is about making important information instantly accessible. "
