

- SELECTED WORK - 2025 - SINGLE-SCREEN REDESIGN

DigiYatra, *in one glance.*

A surgical redesign of the boarding-pass surface used by millions of Indian air travellers - rebuilt around glanceability, hierarchy, and the calm of knowing exactly when your flight leaves.

A CASE STUDY BY **Aryanandha KP**

UI / UX DESIGNER

GLANCEABILITY

HiERARCHY

CALM UI

PLATFORM

Mobile - iOS & Android

SCOPE

Home / boarding-pass screen

YEAR

2025

TOOLS

Figma - Notion

01 - OVERVIEW

A national app, *one missing detail.*

DigiYatra is the paperless airport experience used by millions across India. The technology works. The home screen, however, buries the single most important detail of any travel day - *the flight time* - forcing travellers back to email, WhatsApp, or a paper printout to confirm what the app was meant to surface.

This redesign rebuilds the boarding-pass surface around one principle: critical information should be readable in under one second - the time it takes to glance at a wristwatch.

02 - THE SPARK

A real complaint, from *a real traveller.*

A LinkedIn post from a frequent flyer - published months after the app's national rollout - captured the exact friction the product was meant to remove. It was a single sentence, but it named the problem precisely.

“ *But here's the catch - it doesn't show you the flight time.* ”

• SANANDAN SUDHIR • LINKEDIN • 8 MONTHS AGO

03 - WHAT USERS STRUGGLE WITH

Three frictions, one *flat hierarchy.*

Each of these breaks down the trust users have in the app at the most stressful moment of their day - minutes before boarding.

01 - Visibility

Flight timing not visible

The most important data point - boarding and departure time - is buried or missing entirely from the home view.

02 - Context-switching

Forced to leave the app

Users open WhatsApp, Gmail, or a paper copy to find the time they expected DigiYatra to surface.

03 - Hierarchy

Everything looks equally important

Seat, gate, PNR and flight number are listed without any hierarchy - every element competes for the same attention.

04 - DESIGN GOALS

Two goals. Each design decision had to *defend itself.*

Before opening Figma, a small, opinionated set of goals. No ambiguity, no scope creep - every pixel had to answer to this list.

GOAL 01

Improve *glanceability.*

Critical info readable in under one second - the time it takes to glance at a wristwatch.

GOAL 02

Surface critical info *instantly.*

Time, route, and gate above the fold. No taps, no scrolls, no guesswork.

05 - BEFORE / AFTER

Same data. *Different decision.*

The redesign doesn't add or remove information - it re-ranks it. Time leads. Everything else falls in line behind it.

Final Design

- OUTCOME

$\sim 6_s$ → $< 1_s$

BEFORE - AVERAGE TIME TO FIND BOARDING

AFTER - ONE GLANCE, NO TAPS

“

Good UX is about making important information instantly accessible.
