Software Engineer

Kochi

Family : Husband, 2 Children (8 and 12 years)

Goals :

Book movie tickets quickly for the entire family, find four adjacent seats with the best view, and complete checkout with minimal effort.

Pains :

Finding four seats together is often time-consuming, and hidden convenience fees at checkout make the booking experience frustrating.

Behaviour :

Usually books tickets for the entire family, compares showtimes before deciding, and prefers quick booking with seats together.

Motivation :

Wants a smooth and stress-free booking experience that ensures the family sits together while getting the best value for money.

"I just want four good seats together without spending five minutes searching the seat map."

Current pain points

1. Difficulty Finding Adjacent Family Seats
- Families booking multiple tickets often struggle to find seats together, especially for popular shows. Users must manually scan the seat map and try different seat combinations, making the process time-consuming.
2. Hidden Convenience Fees
- Additional charges such as convenience fees are often revealed only at the final checkout stage. This creates a perception of hidden costs, leading to frustration and reduced trust in the booking experience.

User Flow

Feature

The Problem

Booking movie tickets for groups can be time-consuming. Users often spend several minutes:

- Searching for adjacent seats
- Comparing different rows
- Trying to find the best viewing angle
- Ensuring all members sit together

This becomes more difficult when the theatre is nearly full.

User Pain Points

- Decision fatigue
- Slow booking process
- Difficulty finding seats together
- Uncertainty about viewing and audio quality

The Solution

Introduced a Smart Seat Selection System that automatically recommends the best available seats based on seating availability, viewing angle, and audio experience. Instead of manually selecting seats, users simply enter the number of attendees and the system instantly reserves the most suitable seats.

Benefits

- Less effort
- Faster booking
- Better movie experience
- Guaranteed adjacent seating for groups

Success would be measured through:

- Reduced booking time – Users can complete seat selection faster.
- Recommendation acceptance rate – Percentage of users who accept the suggested seats.
- Higher booking completion rate – More users successfully complete their ticket purchase.
- Lower manual seat changes – Fewer users modify the recommended seats.
